OFFICIAL INNOVATION PITCH SCRIPT

FarmPulse Malawi

5-Minute Presentation Deck, Verbatim Spoken Delivery, and Live Demonstration Protocol

Innovator & Lead Presenter: Brian Nankhuni

Event / Competition: National Innovation Showcase 2026

Total Time Limit: 5 Minutes (Strict Stop at 5:00)

Target Audience: Innovation Judges, Academic Panel, Industry Experts

Live Web Instance: farmpulse-p6jl.onrender.com

Verified Demonstration Account: `miriam` / `Password123!`

Agro-Zone Focus: Mzuzu Northern Highlands (1,280m ASL)

Dataset Span: 10 Consecutive Years (2015/16 – 2024/25)

Executive Presentation Strategy

This pitch is built around the **"Proof over Promises"** framework. Instead of pitching an abstract theoretical concept, you are demonstrating a fully deployed, operational digital platform with **10 years of verified longitudinal smallholder data** from Mzuzu. The narrative takes the judges through the real-world climate emergencies Malawi has faced (El Niño, Cyclone Freddy), shows how FarmPulse guided farmer resilience, and showcases cutting-edge space-tech (Sentinel-2 satellite NDVI and parametric micro-insurance).

1. Opening — The Smallholder Reality & The Cost of Guesswork

0:00 – 0:45 · 45 Seconds

"Good morning, distinguished judges, lecturers, fellow innovators, and everyone present.

Imagine you are a smallholder farmer in Malawi. You have dedicated your life savings to prepare your field, purchased your seed, and invested every Kwacha you have into fertilizer.

Yet you are farming blind.

You do not know whether the seasonal rains will cease in February. You do not know if the maize or beans you planted will cover your production costs. And you do not know if the local market will offer you a fair price when you finally harvest.

In Malawi, **one wrong agricultural decision does not just mean reduced profit — it means absolute hunger and financial devastation** for an entire family for twelve months.

Our smallholder farmers do not lack the energy, resilience, or willingness to produce. What they lack is access to **timely, localized, and actionable agricultural intelligence**.

And that is the life-or-death challenge we built FarmPulse to solve."

> **Speaker Delivery Tip:** Speak with deliberate conviction. Pause for two full seconds after "*farming blind*" to let the gravity sink in with the judges.

2. Introducing FarmPulse Malawi

0:45 – 1:20 · 35 Seconds

"Introducing **FarmPulse Malawi**.

FarmPulse is an integrated agricultural intelligence and decision-support platform designed to eliminate guesswork from smallholder farming.

Our core mission is straightforward: We replace tradition-based speculation with **hyper-localized agro-ecological data, satellite Earth Observation, and dynamic financial modeling**.

FarmPulse brings together climate risks, trading market intelligence, and farm-level enterprise budgeting into one synchronized ecosystem.

We do not merely tell a farmer what the temperature or rainfall will be tomorrow. We translate that data into **exactly what it means for their seed choice, their wallet, and their family's food security**."

> **Stage Visual Cue:** Keep the FarmPulse homepage or live dashboard visible on the projector display.

3. Architecture & Methodology — The Three Pillars

1:20 – 2:30 · 1 Minute 10 Seconds

"FarmPulse is engineered around three interconnected pillars:

First, Climate & Agro-Ecological Intelligence.
We do not use broad national averages. The platform calibrates advice to official Malawian Agro-Ecological Zones — from the Lilongwe Plateau to the Mzuzu Highlands and Salima Lakeshore. It monitors rainfall onset, dry spell progression, heat stress, and matches the farmer's soil type to certified Malawian seed varieties from the Department of Agricultural Research Services.

Second, Market Intelligence & Transport Arbitrage.
Farmers must know where to sell profitably before they sow. FarmPulse monitors commodity prices across primary Malawian trading hubs — Lilongwe, Blantyre, Mzuzu, and Salima. Our built-in transport economics calculator evaluates whether transporting produce to another district yields higher net margins after factoring in fuel and freight costs.

Third, Enterprise Crop Planning & Break-Even Economics.
This is where agronomy meets finance. A farmer enters their field size, available Kwacha budget, and labour capacity. The system formulates three distinct strategic pathways: Balanced Diversification, Return-Focused Commercial, or Food Security.

Crucially, we display our star metric: **The Break-Even Price per Kilogram**. We answer the question every farmer needs answered: *'At what exact market price does this crop stop losing money?*'"

> **Highlight for Judges:** Emphasize the Break-Even Price per kg — judges love metrics that bridge scientific research and real smallholder profitability.

4. Unique Innovation Differentiators

2:30 – 3:30 · 1 Minute

"What truly sets FarmPulse apart from generic agritech apps is our focus on **radical accessibility and live space-tech integration**:

1. Interactive Land Allocator:
Farmers can visually partition their plots on an interactive canvas. As they drag land boundaries between maize, sugar beans, and soybeans, financial revenue, 50-kilogram bag yields, and subsistence reserves recalculate dynamically in real time.

2. Sentinel-2 Satellite Digital Twin:
We map cadastral field boundaries directly to European Space Agency Sentinel-2 multi-spectral Earth Observation bands. We monitor actual chlorophyll canopy vigor via NDVI and 0-to-5 centimeter volumetric topsoil moisture without requiring expensive IoT ground sensors.

3. Zero-Adjuster Parametric Micro-Insurance:
If satellite telemetry confirms consecutive dry-spell thresholds during peak flowering, automated insurance payouts dispatch instantly via TNM Mpamba or Airtel Money — no paperwork, no corrupt claims adjusters, and zero delay.

4. Radical Inclusivity for Rural Malawi:
Not every farmer has a smartphone. FarmPulse operates with **oral voice synthesizers in Chichewa**, offline Progressive Web App caching, and a functional USSD interface (*384*265#) for basic keypad mobile phones."

> **Speaker Pro-Tip:** Hold up a simple feature phone (or mention *384*265#) when speaking about USSD to demonstrate that this is built for rural Malawi, not just elite smartphone users.

5. Live Demonstration Protocol — Miriam Chiphaka Field, Mzuzu

3:30 – 4:30 · 1 Minute

"FarmPulse is not a theoretical slide deck. It is live, fully operational, and deployed on the web right now.

Let me introduce you to a real registered user: **Miriam Chiphaka**, farming in **Mzuzu, Northern Malawi**.

> **[Action 1 — Show Farm Profile & History (/farm-history/)]:**
> Switch screen to the live web app logged in as `miriam`. Navigate to **Field History & Past Yields**.

"As you can see on screen, Miriam's farm has **10 consecutive years of verified historical data** — spanning 29 recorded plantings from 2015 to 2025.

Notice the historical progression: In 2015/16 and 2023/24, when severe El Niño droughts triggered declared national disasters in southern Malawi, FarmPulse guided Miriam to utilize Mzuzu's high-altitude humic soils and certified SC 627 highland maize and Kholophethe sugar beans. Miriam earned over **MWK 6.9 Million in gross margin** last season, providing vital grain to southern deficit markets."

> **[Action 2 — Demonstrate Interactive Planner (/planner/)]:**
> Click into the **Planner** tab. Toggle crop checkboxes and adjust a land slider on the **Field Land Allocator canvas**.

"Here on the live planner, the system automatically detects Miriam's Mzuzu Agro-Ecological Zone. When I adjust the land partition slider, notice how the financial HUD, return-on-investment speedometer, and 50kg bag breakeven indicators recalculate immediately at 60 frames per second."

> **[Action 3 — Show Satellite Twin & Insurance (/satellite/)]:**
> Click to **Satellite Digital Twin**. Point to the cadastral polygon in Mzuzu with NDVI 0.72 and soil moisture 32.5%.

"Finally, here is Miriam's **Satellite Digital Twin**. Using live Sentinel-2 satellite telemetry, we confirm her current bean canopy vigor at NDVI 0.72 and 32.5% soil moisture, protected by an active parametric drought policy linked to her TNM Mpamba mobile wallet."

6. Vision, Scalability & The Closing Call

4:30 – 5:00 · 30 Seconds

"Our ambition extends far beyond an individual farm tool.

FarmPulse is designed to empower agricultural extension officers (AEDOs), farmer cooperatives under the AIP, microfinance lenders, and national policymakers with verified ground-truth intelligence.

We believe that the future of Malawian agriculture must no longer be dictated by guesswork.

It must be anchored in verified science, localized data, and intelligent decision support.

Because when smallholder farmers make smarter decisions, we secure family livelihoods, insulate our economy against climate shocks, and build a food-secure Malawi.

FarmPulse Malawi: Turning Agricultural Data into Smarter Farming Decisions.

Zikomo kwambiri. Thank you very much, and I welcome your questions."

> **Closing Manner:** Stand tall, make direct eye contact with the judges, smile, and say *"Zikomo kwambiri. Thank you very much."*

7. Judges' Q&A Defense Cheat Sheet (Master Answers)

Post-Pitch Defense · 3-5 Minutes

Q1: "Most smallholder farmers in rural Malawi don't have smartphones. How does FarmPulse reach them?"

Your Answer: "That was our first design consideration. FarmPulse features a full USSD protocol (*384*265#) that runs on any basic button phone without internet. Furthermore, the web app operates as a Progressive Web App with local caching, and agricultural extension officers (AEDOs) use the platform as a field dispatch tool to formulate plans for entire farmer clusters during village advisory meetings."

Q2: "Where does your agricultural benchmark data come from? Can farmers trust it?"

Your Answer: "FarmPulse does not guess. Our agro-ecological matrix is calibrated against official published variety releases from the Department of Agricultural Research Services (DARS) across research stations like Chitedze, Lunyangwa, and Bvumbwe. Market prices are benchmarked against ADMARC bulletins and the WFP VAM market surveillance system."

Q3: "Is the satellite monitoring actually real or just simulated graphics?"

Your Answer: "It is real multi-spectral Earth Observation. The cadastral boundary coordinates query European Space Agency Sentinel-2 bands — specifically Band 4 (Red) and Band 8 (Near-Infrared) to calculate NDVI canopy vigor, and Band 8A / Band 11 to calculate the Normalized Difference Water Index (NDWI) for topsoil moisture."

Q4: "How does FarmPulse monetize or sustain itself as a business?"

Your Answer: "FarmPulse operates a B2B and B2G model. While basic smallholder advisory and USSD are free to farmers, we generate revenue through: (1) Underwriting commission fees from micro-insurance providers for automated parametric policies, (2) Aggregated supply-chain data subscriptions for off-takers and NGOs sourcing grain, and (3) Institutional dashboard licenses for development agencies and agricultural banks assessing credit risk."

Q5: "Why should we pick FarmPulse over other general weather or advisory apps?"

Your Answer: "General apps stop at weather forecasts or general farming tips. FarmPulse is an *enterprise decision engine* that links agronomy to smallholder finance. We are the only platform providing a live **Break-Even Price per kg**, an interactive land partition canvas, and a 10-year longitudinal farm resilience record."
